

TASK-6

Gophish is an open-source phishing framework used to help organizations test their own susceptibility to phishing attacks. A great task would be to run a simulated phishing campaign for educational purposes.

Phishing Simulation Campaign Execution Report

Executive Summary :

A simulated phishing campaign was successfully designed, configured, and launched using the Gophish framework. The goal of this educational exercise is to measure the organization's susceptibility to credential-harvesting attacks disguised as official communication (specifically, a login alert).

Technical Setup and Configuration :

- Installation: Gophish software was successfully installed using the provided resources (GitHub link).
- Admin Access: The administrative interface was launched locally at <https://127.0.0.1:3333/>. Initial login was successful using the default credentials (Username: admin, Password: gophish). The password should be immediately reset in a real-world assessment environment to prevent unauthorized access.

Components in a Gophish Campaign :

1. Name

- A descriptive identifier for the campaign (e.g., email-spam).

2. Email Template

- Defines the content, subject line, and sender of the phishing email.

3. Landing Page

- Specifies the fake website the user is directed to after clicking the link.

4. URL

- The external link that will be embedded within the phishing email. This URL points to the Gophish server (<https://gem...>) and hosts the malicious landing page. It is the address recipients will click.

5. Launch Date

- The specific date and time the Gophish server should begin sending the campaign emails.

6. Sending Profile

- The configuration details of the external SMTP server used to send the emails (set up in the Sending Profiles tab).

7. Groups

- The list of target email addresses and user details (First Name, Last Name, Position, etc.) that will receive the phishing email.

•

Once you click "Launch Campaign," Gophish uses the selected Sending Profile to send the Email Template to everyone in the selected Groups. Each email contains the unique tracking link ({{.URL}}) that points to the Landing Page.

Results Analysis Methodology:

The primary purpose of this exercise is to derive actionable security awareness metrics. The upcoming Results Analysis Report will focus on the following key metrics captured in real-time by Gophish:

This screenshot shows the 'New Sending Profile' form in the Gophish dashboard. The form includes fields for Name (John), Interface Type (SMTP), From (njanakulal@gmail.com), Host (smtp.example.25), Username (admin), and Password (root). There is also a checkbox for 'Ignore Certificate Errors'.

This screenshot shows a confirmation dialog box with a question mark icon. The text reads: 'Are you sure? This will schedule the campaign to be launched.' There are 'Cancel' and 'Launch Campaign' buttons.

This screenshot shows the 'New Template' form in the Gophish dashboard. It includes fields for Name (John Abraham), Subject (New Job Offer at Jinhstart), and a text area for the email body. There is an 'Import Email' button and a checkbox for 'Add Tracking Image'.

This screenshot shows the 'New Landing Page' form in the Gophish dashboard. It includes a Name field (email), an 'Import Site' button, and a large text area for HTML content. There is a checkbox for 'Capture Submitted Data'.
