1. Introduction

Gophish is an open-source phishing framework designed to allow organizations to test and improve their phishing awareness. This report documents a simulated phishing campaign run in a virtual machine (VM) environment for educational purposes. All actions were performed in a controlled lab environment and no real users or external domains were targeted.

2. Objective

The objective of this task is to set up a Gophish instance, create a sending profile, design an email template and landing page, run a simulated phishing campaign, capture results (opens, clicks, submitted credentials), and analyze the outcome to produce recommendations.

3. Tools and Environment

Tools used:

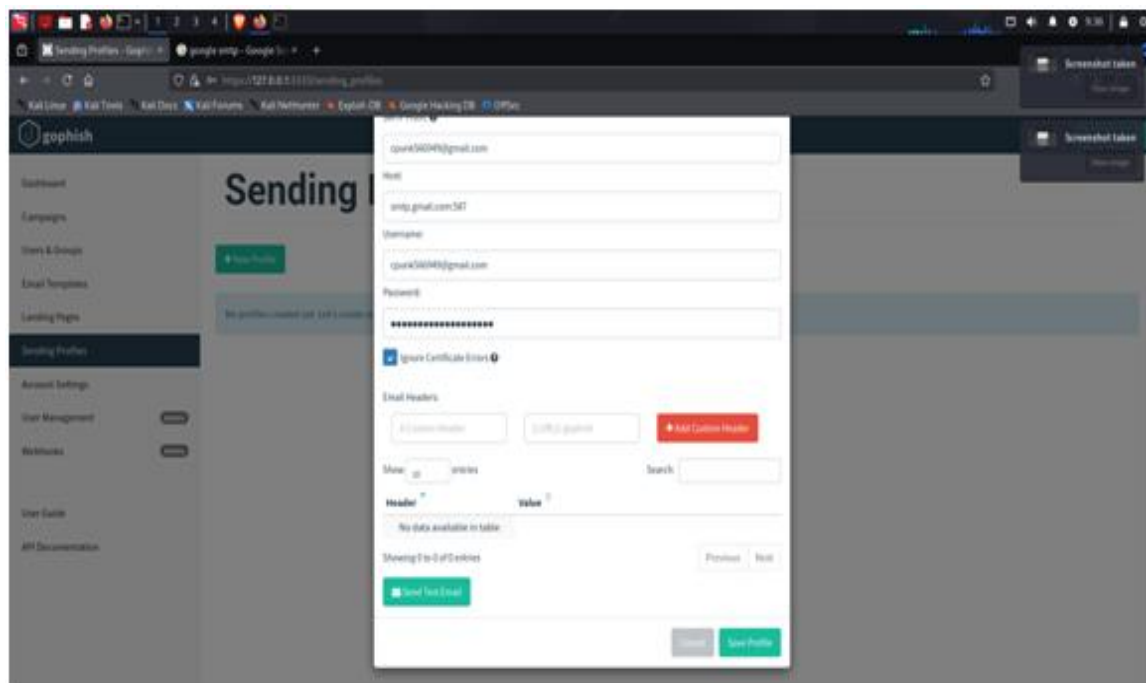

- **Gophish (<https://getgophish.com/>)**
- **Virtual Machine software (e.g., VirtualBox / VMware)**

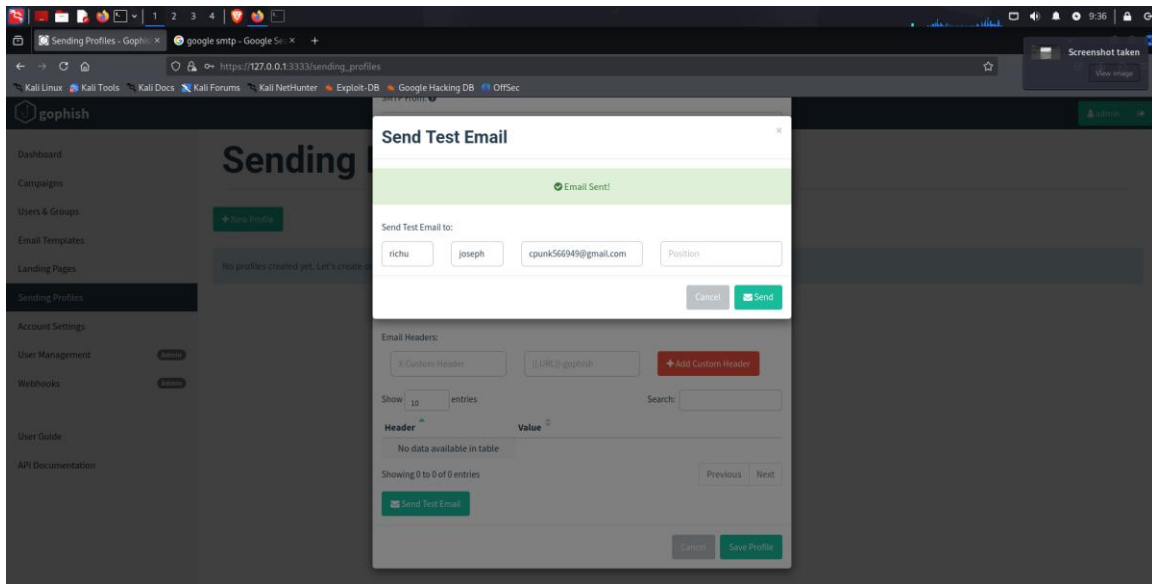

4. Preparations

This section lists the artefacts created before starting the campaign. Include screenshots of each where indicated.

4.1 Sending Profile

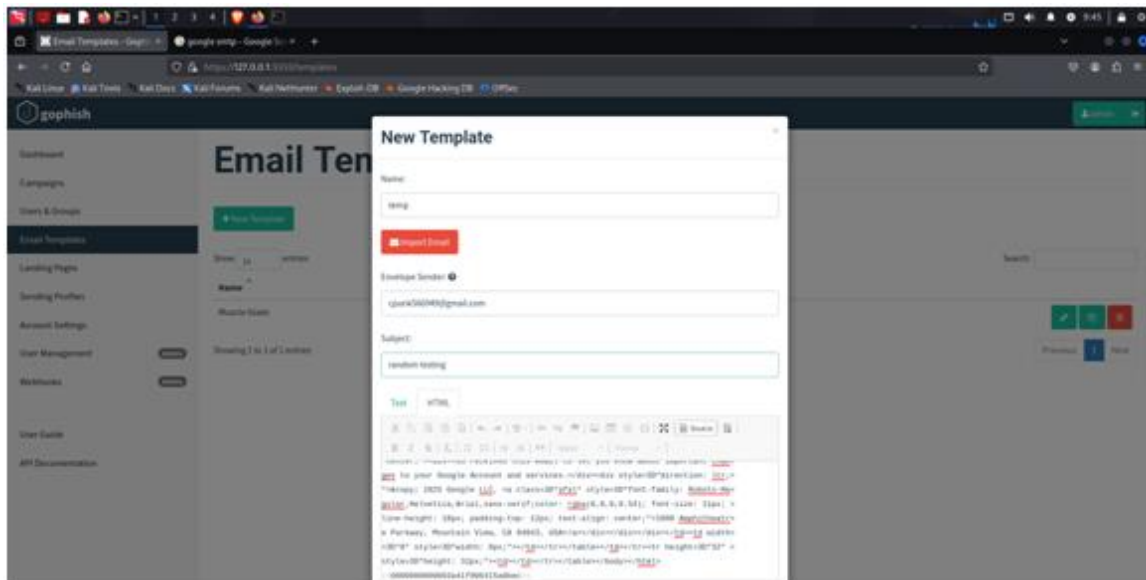

Description: The sending profile contains SMTP settings used to send phishing emails (sender address, SMTP server, port, username, password, TLS).

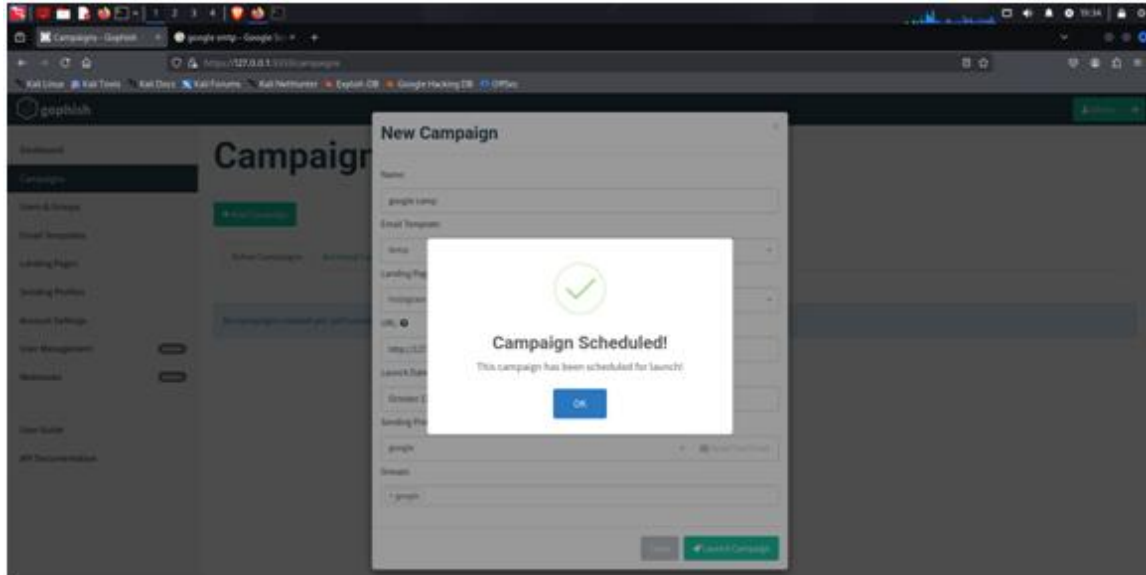

4.2 Email Template

Description: The email template contains the message content sent to recipients. It may include variables and tracking links.

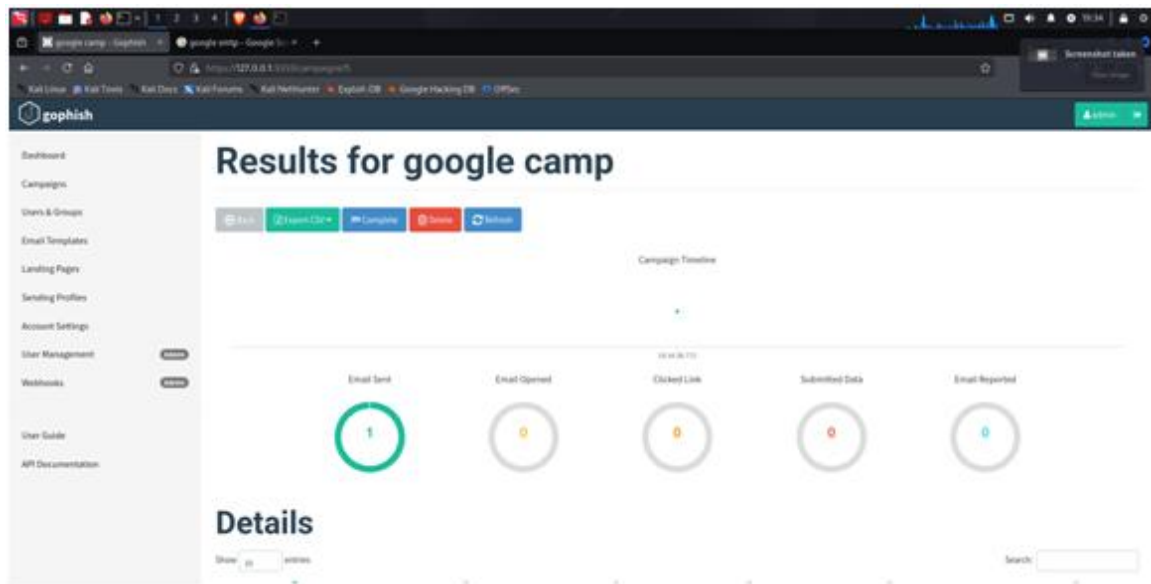

4.3 Campaign Page

Description: phishing site is where recipients are directed when they click the link. Typically mimics a login page to capture credentials.

4.4 Campaign Dashboard

Description: The campaign dashboard shows campaign stats (emails sent, opened, clicked, submitted).

End of Report.

Prepared using Gophish and documented by the Me.
